

BAROMETER

CERTIFICATE OF GUARANTEE

This barometer movement has been designed and tested to meet particularly exacting requirements. It can therefore be guaranteed for manufacturing and presentation standards.

Height setting: Barometers should be adjusted according to the altitude of their location which is a factor of variation. This can be done, for instance, by comparison with the town or local barometer.

Setting is performed by turning the crew at the back of the barometer, in the right direction, until the blur pointer reaches the division corresponding to the one on the standard barometer.

Utilization: Every evening, for instance, set the mobile index over the pointer. In the morning, if it has moved back, the weather will be bad. If the index moves back over the pointer, that means the weather will improve.
